

2. As you probably know in Javascript there is the variable type String. One of its functions is "toUpperCase", therefore we can do the following thing:

```
var s2 = "Hello World!";  
alert(s2.toUpperCase ()); <- this will return: HELLO WORLD
```

How do you rewrite the above function in order to return this text (HELLO WORLD!) in small letters?

String variables also have the `toLowerCase()` function that converts all the letters of a word to lowercase.

```
var s2 = "¡HELLO WORLD!";  
alert(s2.toLowerCase()); // This returns "¡hello world!"
```
