3. Using the next function, the console should show the message: "Openbravo!!!"

```
mostrar = function(param){
    param();
}
```

The variable `mostrar` is a function that receives as a parameter another function and executes it, so we could pass as a parameter a function that simply prints in console "Openbravo!!!", as follows.

```
mostrar = function(param){
    param();
}

mostrar((a) => console.log("Openbravo!!!"));
```

In this way, `mostrar` receives as a parameter a function that simply prints on the console "Openbravo!!!" when invoked.
